

GreenLeaf Organics — Annual Sustainability Report 2025

Carbon Footprint Reduction

GreenLeaf Organics reduced its total carbon emissions by 22 percent in the past fiscal year through a combination of renewable energy adoption and optimized delivery routing. The company's primary production facility in Oregon now draws 68 percent of its electricity from an on-site solar array installed in March 2025.

All packaging materials produced at the Oregon facility are manufactured using solar-powered equipment, and the company has committed to expanding solar packaging production to its second facility by the end of next year.

Water Usage and Conservation

Water consumption per unit produced decreased by 15 percent following the installation of a closed-loop irrigation system at the company's farming partners. Rainwater collection tanks now supply approximately 40 percent of the water used in the primary growing operations during peak season.

Waste Reduction Initiatives

GreenLeaf Organics diverted 91 percent of operational waste from landfills in 2025 through composting and recycling programs, up from 74 percent the previous year.
