

Northwind Logistics — Fleet Maintenance and Safety Policy

Vehicle Inspection Requirements

Every delivery vehicle operated by Northwind Logistics must undergo a full mechanical inspection every 5,000 miles or every 60 days, whichever occurs first. Inspections must be logged in the fleet management system before the vehicle returns to active duty.

Tire condition must be checked before every shift. Tires showing tread depth below 4/32 of an inch must be replaced before the vehicle is dispatched. Brake pads are inspected during the scheduled 5,000-mile service interval.

Driver Pre-Trip Safety Checklist

Drivers are required to complete a pre-trip walkaround inspection covering lights, mirrors, tire pressure, and cargo securement before any vehicle leaves the depot. Any defect identified must be reported to the maintenance team immediately, and the vehicle must not be dispatched until the issue is resolved.

Emergency Roadside Procedures

In the event of a mechanical failure during a delivery route, drivers must contact dispatch immediately and move the vehicle to a safe location if possible. A replacement vehicle will be dispatched within 90 minutes for time-sensitive deliveries.
